

Project “TasteTS”

Evaluation before database planning

1. Progress

Feature list is completed, and multi-language support approach is chosen.

2. Achievements

Despite of the fact that project is in the early stages of development, the general picture is quite clear. The initial state in which the program will be implemented is not that complicated, and future extensions shouldn't pose a problem.

3. Next step

The next task is designing, and implementation of the database.

The challenges may include:

- Storing the ingredients, as some users may use some of the lesser known of them, that are not already in the database, where they could be indexed.
- The above, also can lead to problems with multi-language support implementation.
